

USA Fibroid Centers – Roy, UT

About Us

USA Fibroid Centers is a national network of exceptional Fibroid Centers specializing in the leading non-surgical procedure to treat fibroids with no hospital stay: Uterine Fibroid Embolization (UFE). Our leading interventional radiologists are fibroid specialists and provide each patient with a customized treatment plan. Most treatments at USA Fibroid Centers are covered by major insurance plans. Our physicians have helped hundreds of women enjoy their life without painful and prolonged menstruation, heavy bleeding, pelvic pain and pressure.

We are a leader in non-surgical outpatient fibroid treatment. Using the most cutting-edge procedures helps our patients live a better life without a hospital stay.

We aim to increase awareness of fibroid symptoms (pain, pressure, heavy bleeding) and improve quality of life for every woman with this common condition.

What are Uterine Fibroids?

Uterine fibroids are the most common tumor of the female reproductive tract. Although non-cancerous, they cause significant harm to nearby organs as well as anemia due to heavy menstrual bleeding. These benign tumors are also known as uterine **myomas** or **leiomyomas**. Several factors may influence their formation, such as hormones and genetics. It is estimated that 8-33% women develop fibroids during their child bearing years. Common symptoms of fibroids are **heavy, prolonged and painful menstrual periods, lower back pain, pelvic pressure and pain during intercourse**. Patients with fibroids also suffer from poor sleep due to frequent urination from fibroid pressure on the urinary bladder. **Heavy menstruation** can cause **anemia** with **fatigue** and general lack of energy. These symptoms often impact a woman's social life, work, family interactions, sex life and even lead to **depression** and low self-confidence.

Uterine Fibroid Embolization

Uterine fibroids are an overgrowth of muscular and fibrous tissues, typically developing in the walls of the uterus. They are the most common tumor of the female reproductive tract. Though they are benign, they cause significant harm to nearby organs, as well as anemia due to heavy menstruation. USA Fibroid Centers uses the gold standard in treatment for fibroids called **Uterine Fibroid Embolization (UFE)**. The latest in non-surgical, minimally invasive fibroid treatments, UFE is performed as an outpatient procedure, which means there's no hospital stay, and you can recover at home. Our medical team first makes sure you are comfortable, and then our interventional radiologists give you a light sedative to help you relax. Using ultrasound as a guide throughout the procedure, our doctors are able to treat all the fibroids at once in approximately **30-45 minutes**. Patients make a full recovery in one to two weeks.
